BRITISH ELECTION STUDY

2024 Election Provisional Panel Dataset

Combined Waves 1-26

University of Manchester
University of Oxford
Royal Holloway

Introduction

What is the 2024 Election Provisional Dataset?

The early release of this dataset reflects the timing of the UK General Election and the strong user demand for releasing BES data ahead of the election. As data for Wave 26 was collected in May 2024, this dataset represents the closest panel data available to the start of the campaign.

However, there are some important points that users must be aware of when using this data. First, in order to release this data earlier than scheduled, the dataset has not been subjected to our usual level of checks. Consequently, there may be some small mistakes in labelling or coding. We advise users to be cautious when performing any analysis when using this dataset, and to consult this codebook when handling the data. If you notice any mistakes, please contact bes@manchester.ac.uk.

Second, the data collection for the latest wave of the internet panel (Wave 26) took place between May 3rd 2024 and May 22nd 2024, and was completed before the election was called. As a result, it should be understood in this context.

What is the British Election Study?

The British Election Study 2014-2024 is managed via a consortium of the University of Manchester, the University of Oxford and Royal Holloway, University of London. The Scientific Leadership Team is comprised of Professor Ed Fieldhouse, Professor Jane Green, Professor Geoff Evans, Dr Jonathan Mellon, and Dr Christopher Prosser. The team is supported by Drs. Jack Bailey, James Griffiths, and Stuart Perrett.

What is the internet panel?

The internet panel represents a series of questions asked of individuals within Britain (England, Scotland, and Wales) between 2014 and 2024. These questions focus on politics in Britain, which includes voting behaviour, political party identity, and political attitudes.

Panel studies seek to ask the same respondents (the people answering the survey) questions at several different points in time. However, people drop out of panel studies (i.e., they participate in one survey wave, but not another). As a result, we frequently add new respondents to the study to ensure that each individual wave has approximately 30,000 respondents.

For details on the number of participants in each wave, as well as the retention rates between waves (i.e., how many people took multiple waves), please see the main documentation for the British Election Study Internet Panel.

What is weighting?

Each wave represents a representative sample of the British public. However, no sample will be a perfect reflection of the British public, as some samples may include more/less of certain groups than is found in the population. To mitigate these imbalances, we have included survey weights that help ensure that the data matches the population covered in this study (i.e., the British public).

In the wide format dataset, each wave has a variable called 'weight'. In the long-format dataset, there is a single variable called 'weight'. For the first four waves, these 'weight' variables follow YouGov's old weighting format, and from then on it uses their new weighting format. Wave 26 includes the

'new' weight. All weights are constructed at the regional level (i.e. Scotland, England, Wales and London are weighted separately to population values) and then adjusted to account for the oversampling of Scottish and Welsh voters.

<u>What are the constituency boundaries?</u>

This provisional dataset includes the old (2010-2024) and new (2024 onwards) constituency boundaries. All geographic variables in the BES Internet Panel come from YouGov's database of panellist-specific profile data. YouGov collects these data on panellists from time to time, most often outside of our panel. We link these data (routed from postcode sector) to each of our respondents in the panel, and take the most recently observed instance of each geographic variable before the date that each respondent took our survey. In some cases, the respondent's postcode sector will overlap more than one linked geographical area. In these cases, we assume that the respondent lives in the area that the postcode sector shares the greatest overlap. Most of the time these geographic variables will be consistent, but in some cases they may not be. As such, we advise our users to check the geographic variables in the data carefully before conducting any analyses.

We have retroactively separated respondents into the new constituencies for all waves of the panel, even though they did not exist at that time. This is to allow for analyses of change over time using the new boundaries.

<u>How have you coded the most important issue questions?</u>

Responses in wave 26 were coded using GPT-4o from OpenAI. This approach allows us to quickly code the open-ended survey responses for the most important issue, with the validity of this approach tested within <u>Mellon et al. (2024).</u>
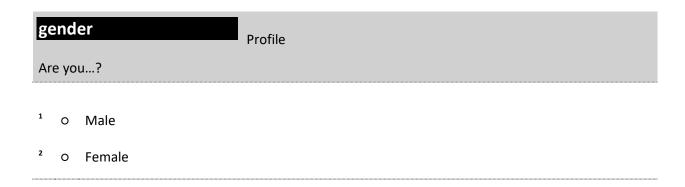

<u>What are our naming conventions?</u>

Waves taken: In the wide format data, we denote the wave that a variable was included in (e.g., W1 indicates a variable that was included in wave 1, whereas W25 indicates that a variable was included in wave 25). In the long format data, we indicate the wave that a person took in the variable "wave".

Top-up variables: Top up items are asked to all respondents in the first wave that they take part in. For example, someone in wave 1 of a top up variable would be asked this question then, whereas someone who entered the panel in wave 2 would be asked this question then (while the first person would not be re-asked this question). These are generally demographic and attitudinal variables that are relatively stable over time. While some of these can change, they do not need to be asked in every wave. These top-up items appear like any other item in the wide and long format datasets, but they are labelled as top-up items in the documentation. Users can find the specific wave where a person was asked the top-up item by comparing the documentation and the first wave of a top-up series that a person appeared in.

Profile variables: The BES also includes much of the information that YouGov routinely collects about all members of their panel. These include items like education, working status, housing, income, marital status, ethnicity, religion, sexuality, and disability status. Having these measures from YouGov's existing data leaves more space for other important questions on the rest of the survey and avoids asking respondents for information they've already provided in the past. These variables have the prefix 'p_'. Profile variables are collected at intervals determined by YouGov and therefore should not be assumed to be measured at the time of a wave. Profile information with a wave identifier attached indicates that the profile data was the most up to date available at the time of that survey.
